

How does the lockout card actually work?

How does the lockout card actually work? I saw your bulletin that shows how to disable by removing the PT1, but I don't want to do that. Does the card just block the connection between the PT1 and the item marked LED? What is the actual connection made with...light?

Reply #1

The connection is made with light. The receptor is blocked by the key card which "unlocks" the temperature control.
